

Add a new **"Invoke"** property tab for Agents across the platform.

Invoke Tab Requirements

The **Invoke** tab must support defining both **Input Parameters** and **Output Parameters** for an Agent invocation.

Parameter Structure

Each parameter must contain:

- **Parameter Name**
 - Mandatory constant string identifier.
 - Can be referenced anywhere during workflow execution using template syntax:
 - `{{wf.parameter_name}}`
- **Parameter Value**
 - Supports multiple data source types:
 - Constant values
 - Workflow execution data
 - Tool execution outputs
 - Data Model fields

Supported Value Types

Assume a Workflow named **"Loan Sanction Process"** associated with a Data Model also named **"Loan Sanction Process"**.

1. Constant Values

Examples:

- 123
- "Approved"
- "12/05/2026"

2. Workflow Execution Data

Examples:

- `{{wf.status}}`

- {{wf.token_limit}}
- {{wf.timetaken}}

3. Tool Execution Outputs

Examples:

- {{tool.Data_Transformer.output}}
- {{tool.Credit_Check.result}}
- {{tool.Email_Notifier.status}}

4. Data Model Fields

Examples:

- {{Applicant.full_name}}
- {{Applicant.date_of_birth}}
- {{Disbursement.mode}}
- {{CreditAssessment.remarks}}

Workflow Runtime Behavior

Workflow Initialization

- At workflow start, automatically create a new JSON instance for the associated Data Model.
- This JSON instance acts as the runtime execution data store for the workflow.

Agent Execution Logic

While executing an Agent:

Input Parameters

- Resolve input parameter values using:
 - Constants
 - Workflow execution data
 - Tool outputs
 - Data Model runtime JSON values
- Pass the resolved values into the Agent invocation payload.

Output Parameters

- Capture Agent response values.
 - Map and persist output parameter values into the runtime Data Model JSON instance.
-

Workflow Completion

At workflow completion:

- Return the updated Data Model runtime JSON instance along with all existing workflow output variables.
-

Platform-Wide Implementation Scope

Implement Invoke tab support consistently across all related platform capabilities, including but not limited to:

- New Workflow
 - Workflow Studio
 - Agent Library
 - Workflow Runtime Execution
 - Workflow Run History
 - Export / Import Cutomers
 - Templates
 - Execution Replay
 - Any other feature interacting with Agent configuration or workflow execution
-

Technical Expectations

- Maintain backward compatibility for existing workflows and agents.
- Support dynamic runtime resolution of parameter references.
- Validate parameter references during workflow design-time wherever possible.
- Ensure execution-time failures provide meaningful validation/error messages.
- Support extensibility for future parameter source types.

- Ensure import/export preserves Invoke parameter mappings and references exactly as configured.
